The Complete Monitoring Solution for Cloud Services

Centerity Monitor is an enterprise class compliance software for cloud environments which allows service providers and organizations to achieve availability, performance, service level reporting, and operational efficiency & control to their infrastructure.

Centerity Monitoring solutions includes enterprise tools such as business service management, user experience monitoring, infrastructure monitoring, hardware & software inventory, application monitoring, monitoring provisioning, automation and more.

Cloud monitoring highlights

- ❖ Monitor physical, virtual, cloud and outsourced assets from one central dashboard.
- ❖ Business services availability - validate business continuity upon failures.
- ❖ User experience - record simple and complex scenarios and validate service delivery.
- ❖ Single management and monitoring tool - control over the datacenter and the cloud with complete infrastructure monitoring using Agents and Agentless methods to monitor any virtual machine (Windows, Linux) infrastructure, performance, analyze log files, database connectivity, networking (traffic usage, network availability and performance).
- ❖ Cloud API - to monitor instances, pricing, web service information.
- ❖ Problems isolations - using root cause analysis and event correlation.
- ❖ Alerts & notifications– receive immediate notifications of service failures, use escalations engine to notify responsible owners & customers using: email, SMS, RSS feeds and more.
- ❖ Tickets – incidents and tickets management.
- ❖ Reports – capacity usage and planning, SLA management and reporting.

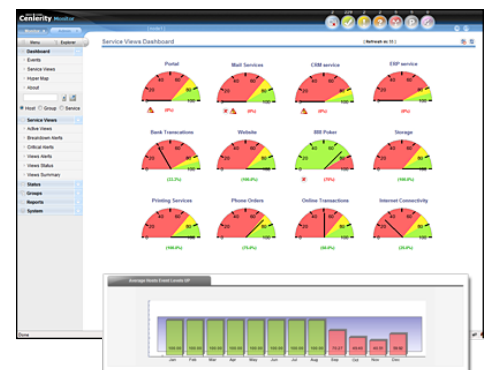

Business service delivery

Business service management enables new ways to analyze and understand business services and application status delivered for external or internal customers.

Centerity Monitor allows you to see the overall health of specific business services within your enterprise virtual environment or services provided in public clouds. From E-mail infrastructure, website availability, shopping carts, bank transactions, CRM, ERP hosted applications and virtual infrastructure status and more. By providing layers logical maps of services you can rapidly see why a business service is having issues, drill down into deep forensics and improve MTTR within your organization.

Dashboard

Business Views

“Centerity Monitor provided us with a complete monitoring solution for Netvision’s data center entire infrastructure, including: physical infrastructure, hosted servers, virtual servers, network devices, firewalls, electricity foundations and more. By providing our customers different types of monitoring packages according to their needs, from basic monitoring with reports and notifications to complex and comprehensive monitoring, application monitoring and user experience measurement.

Centerity solution improved our efficiency, allowed us to proactively react to problems and reduced our downtime and breakdowns without impacting our budget, shortened MTTR and response time and improved our customer services”

Oren Daniel
NOC Manager 013 Netvision

User experience monitoring

Centerity Monitor allows users to record and run GUI and protocols (HTTP, HTTPS, TCP, Web services) synthetic transactions for applications and services. Centerity eXperience add-on delivers recording options for simple and complex scenarios and measure performance response time and availability from multiple locations to validate service delivery.

Provisioning and automation

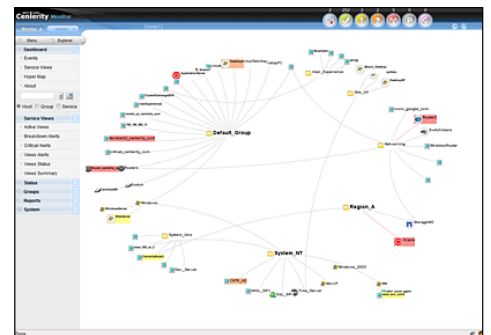

Centerity Monitor provides private or public hybrid cloud monitoring options for MSP's, datacenters and enterprises, efficient and innovative solutions with high flexibility and scalability to hundreds of thousands of monitoring devices and services simultaneously. Centerity API's allows easy configuring and deploying new monitored devices and services from your local CRM, ERP or helpdesk applications.

Security & user permissions

Centerity Monitor is designed to work in multi-tenant environments, and allows you to visualize, display and build custom dashboards, views and reports for different types of customers, organizational units and users. Storing monitoring, technical and administrative information in built-in CMDB engine provide user's roles for each customer at the same time.
